

IAC AMERICA AND LAWRENCE HALL IS BUILDING A BETTER COMMUNITY

The IAC Noishield® Roof Sound Barrier Systems are designed to protect communities against noise from air conditioners, pumps, compressors and fans. In the Chicago area, Lawrence Hall Youth Services is a non-profit child welfare agency designed to improve the community by developing the self worth, knowledge and skill of their youth to lead independent productive lives. Together IAC and Lawrence hall are making the community a better place.

IAC Noishield® Roof Top Barrier Systems are designed and pre-engineered including structural steel and support systems. The panels are 5" thick and absorptive on one side. The panels are factory finished using a polyester powder coating for exterior applications and are available in over 100 colors. The low weight panels are two foot tall and stack vertically to achieve any height and configuration.

The roof-top barrier includes more than 50 individual panels which can be removed for major equipment access. The system also included an IAC Noise-Lock® door for "regular" maintenance access to the equipment.

Another successful turn-key roof-top barrier application that delivers the acoustic and aesthetic expectation of the architect without compromising the operation of the mechanical equipment located on the roof-top.
